	$\frac{1}{3} \neq \frac{-2}{4}$	1/2
	As, $\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$ is one condition for consistency.

33	Given:-	
	Speed of boat =18km/hr Distance =24km	
	Let <i>x</i> be the speed of stream.  Let <i>t</i> 1 and <i>t</i> 2 be the time for upstream and downstream.  As we know that,	1/2
	speed= distance / time ⇒time= distance / speed	
	For upstream, Speed =(18-x) km/hr Distance =24km Time =t1 Therefore,	1/2
	$t_1 = \frac{24}{18 - x}$	
	For downstream, Speed =(18+x)km/hr Distance =24km Time =t2 Therefore,	
	$t_2 = \frac{24}{18 + x}$ Now according to the question-	
	t1=t2+1	
	$\frac{24}{18-x} = \frac{24}{18+x} + 1$	
	$\Rightarrow \frac{24(18+x)-24(18-x)}{(18-x)(18+x)} = 1$	1/2
	$\Rightarrow 48x = (18-x)(18+x)$	
	$\Rightarrow 48x = 324 + 18x - 18x - x^2$	
	$\Rightarrow x^{2}+48x-324=0$ $\Rightarrow x^{2}+54x-6x-324=0$ $\Rightarrow x(x+54)-6(x+54)=0$ $\Rightarrow (x+54)(x-6)=0$	

$\Rightarrow$ x=-54 or x=6	1/2
Since speed cannot be negative.	
⇒x=-54 will be rejected	
∴ <i>x</i> =6	
Thus, the speed of stream is 6km/hr.	1

Let one of the odd positive integer be x	
then the other odd positive integer is $x+2$ their sum of squares = $x^2 + (x+2)^2$	1
$= x^{2} + x^{2} + 4x + 4$ $= 2x^{2} + 4x + 4$	
Given that their sum of squares = 290 $\Rightarrow 2x^2 + 4x + 4 = 290$	
$\Rightarrow 2x^2 + 4x = 290 - 4 = 286$	4
$\Rightarrow 2x^2 + 4x - 286 = 0$ \Rightarrow 2(x^2 + 2x - 143) = 0	1
$\Rightarrow x^2 + 2x - 143 = 0$ \Rightarrow x^2 + 13x - 11x - 143 = 0	
$\Rightarrow x(x+13) - 11(x+13) = 0$ \Rightarrow (x -11)(x+13) = 0	
$\Rightarrow$ (x-11) = 0 , (x+13) = 0 Therefore , x = 11 or -13	
According to question, x is a positive odd integer. Hence, We take positive value of x	1
So , $x = 11$ and $(x+2) = 11 + 2 = 13$ Therefore , the odd positive integers are 11 and 13 .
